Part 2: Database Installation

[Previous](#) | [Next](#)

Installation

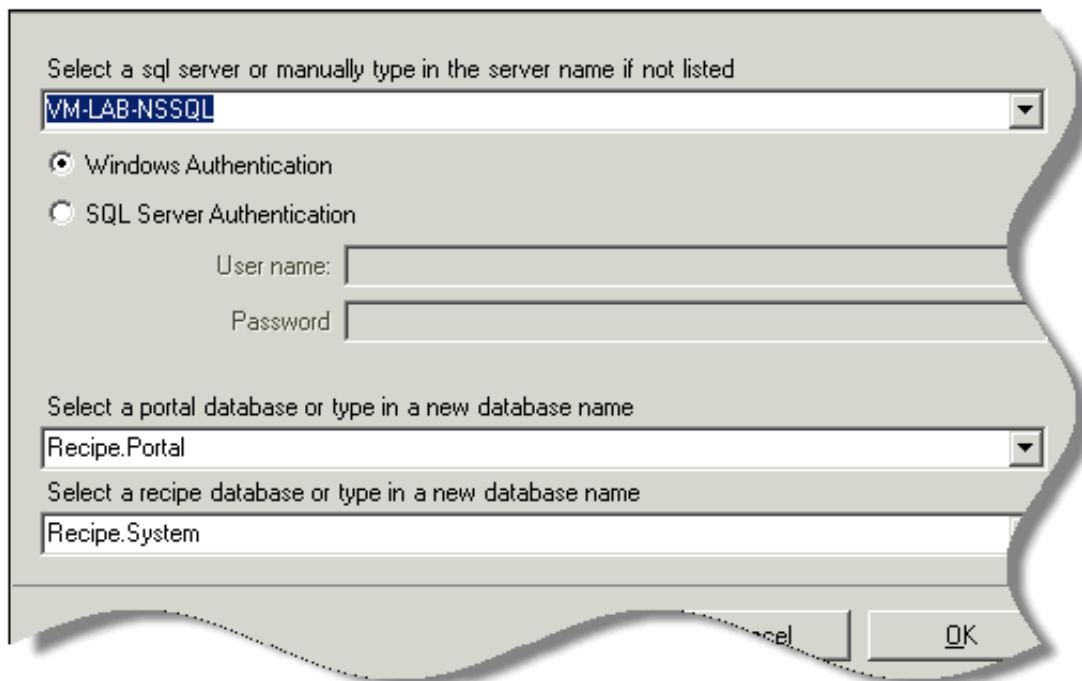

The installation wizard is broken up into two parts: the recipe viewer portal and database. If you choose to install the editor application, it will also run that wizard. This documentation will cover the entire installation wizard with the recipe editor option checked.

The database installation wizard will open at the end of the portal web configuration. If you have not covered the portal installation section, [click here](#).

Database Installation

 If you have not read the requirements section, you must review it before installing. [Access the additional Microsoft requirements here](#).

1. Select the SQL server from the dropdown menu.
2. Select Windows Authentication or SQL Authentication. See your SQL Administrator or IT personnel for the correct log in type to use.
3. Select a database name for the Portal. The default is "Recipe.Portal".
4. Select a database name for the Recipes. The default is "Recipe.System".
5. Click **OK** to continue. The installation wizard will now attempt to connect to the SQL server listed. If the proper credentials are not used, the connection will not be established.

The screenshot shows a Windows-style dialog box titled "Database Installation". It contains the following elements:

- A label: "Select a sql server or manually type in the server name if not listed".
- A dropdown menu with "VM-LAB-NSSQL" selected.
- Two radio buttons: "Windows Authentication" (selected) and "SQL Server Authentication".
- Two text input fields: "User name:" and "Password:".
- A label: "Select a portal database or type in a new database name".
- A dropdown menu with "Recipe.Portal" selected.
- A label: "Select a recipe database or type in a new database name".
- A text input field with "Recipe.System" entered.
- At the bottom right, there are two buttons: "Cancel" and "OK".
