Installation Requirements

[Previous](#) | [Next](#)

This section will cover software components that are required prior to installation. Read carefully to ensure that everything  is installed before running setup. See the Requirements documentation available on the NorthStar website for a complete listing of hardware and software.

Microsoft Software Requirements

Review the Minimum Requirements documentation before installing. The steps of the installation are as follows:

- Verify that the System Requirements have been met
- Install the [Microsoft AJAX Extensions](#)
- Install the [Microsoft .NET Framework 3.5 SP1](#)
- Install the [Microsoft Report Viewer Redistributable 2005 \(Editor Only\)](#)
- Install Recipe System

Downloads

Download the Recipe Viewer Portal installation from the NorthStar Enterprise web site. If you do not have a customer login, speak to your sales person or project manager. The Recipe installation is posted in **Downloads> NS Recipe Viewer Downloads**. Recipe System requires additional Microsoft components. Information on these requirements is below.

Microsoft Reports Viewer 2005 Redistributable

The Recipe Editor program requires this redistributable package from Microsoft. If you are installing the Editor you will need to run the update from Microsoft first. A link to the update is posted on the NorthStar web site.

Microsoft AJAX Extensions Update

Recipe also requires an AJAX extensions update from Microsoft. A link to the update is posted on the NorthStar web site.

.NET Framework 3.5 SP1 Setup

The setup process will install the .NET framework. This can take several minutes depending on the system. If the .NET 3.5 SP1 is already installed on the system, the setup utility will not run this section.

Note: If the .NET 3.5 Service Pack 1 is not installed, the setup utility may display an error after the system reboots. To continue the installation, you will need to close the error and run the installer again. It is highly recommended that you install the framework update before running the portal installation. A link to the update is posted on the NorthStar web site.

Overview

The installation process consists of the following steps (in order).

- Verify the System Requirements for the Recipe System have been met.
- Install the Microsoft AJAX Extensions.
- Install Recipe System.
- Microsoft Report Viewer Redistributable 2005 Setup (Editor Only)

Downloads

Download the Recipe System installation at the [NorthStar Enterprise](#) web site. If you do not have a customer login, speak to your sales person or project manager.

Microsoft Reports Viewer 2005 Redistributable

The Recipe Editor program requires this redistributable package from Microsoft. If you are installing the Editor you will need to run the update from Microsoft first. A link to the update is posted on the NorthStar web site as well as below.

Microsoft Ajax Extensions

Recipe also requires an AJAX extensions update from Microsoft. A link to this update can be found on the Recipe System downloads tab. You can also click below for the update.

[Microsoft AJAX Extensions Update](#)

.NET Framework 3.5 SP1 Setup

The setup process will install the .NET framework. This can take several minutes depending on the system. If the .NET 3.5 service pack 1 is already installed on the system, the setup utility will not run this section.

Note: If the .NET 3.5 Service Pack 1 is not installed, the setup utility may display an error after the system reboots. To continue the installation, you will need to close the error and run the installer once again. A link is provided on the Recipe downloads tab as well as below.

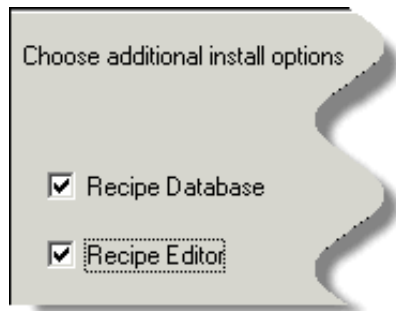

[Microsoft .NET Framework 3.5 SP1 Setup](#)

Installation

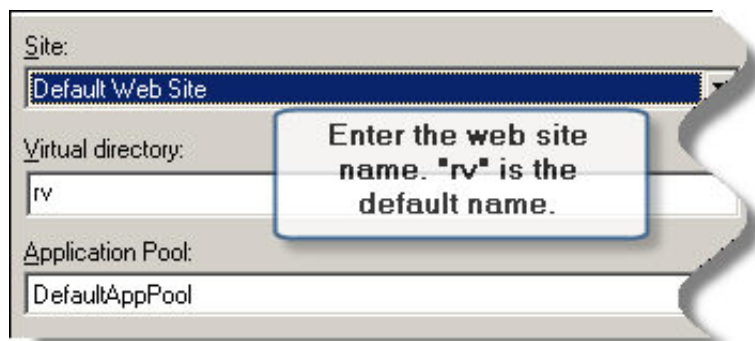

Run the Recipe System installation. Once the components have been installed the Recipe Viewer Setup Wizard will open.

PORTAL INSTALLATION

- Once the Recipe Viewer Setup Wizard opens, click Next to continue with the installation.
- The EULA (End User License Agreement) will open. Click I agree and Next to continue.
- Choose the applications that you want to install. The applications are the Recipe Portal and the Recipe Editor. If this is the portal server, you will want to make sure the Recipe Portal is checked.

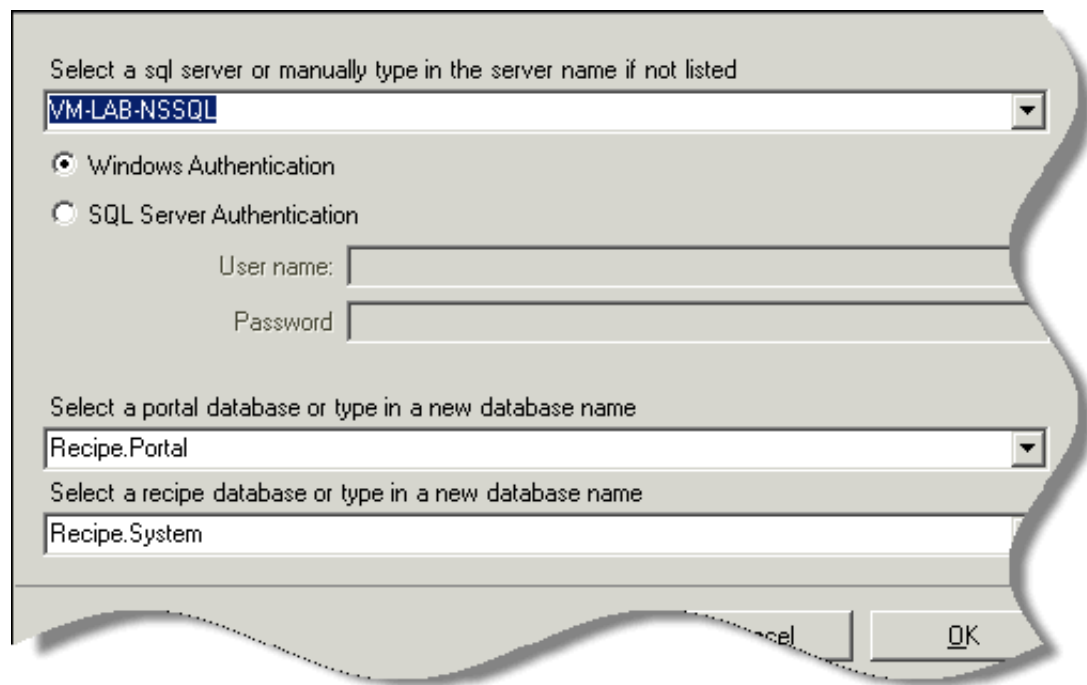

- A Site dropdown will display. The Recipe Portal only installs as a virtual directory from a web site. The default website is "Default Web Site". If this is not the name of your Web Site in IIS you can change it here.
- Enter the Recipe web site name. "rv" is the default.
- If you want to use a different application pool, you can select it in the dropdown menu.
- Click Next to continue.
- Click Next again to complete the Portal installation (this installed the actual portal web site and configures IIS with the site information).

DATABASE INSTALLATION

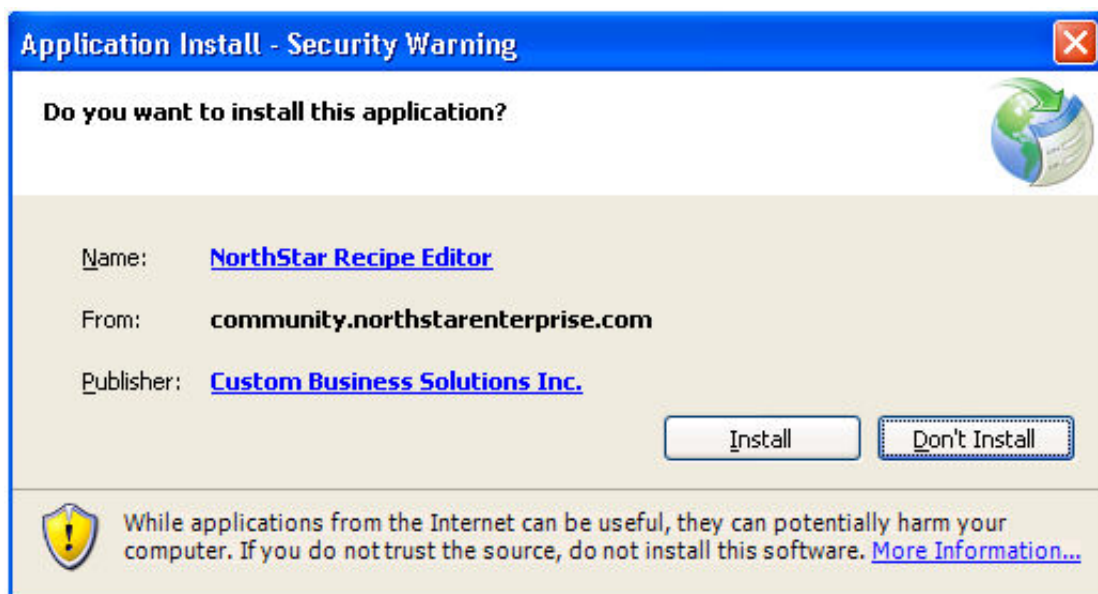

- Select the SQL server from the dropdown menu.
- Select Windows Authentication or SQL Authentication. See your SQL Administrator or IT personnel for the correct log in type to use.
- Select a database name for the Portal. The default is Recipe.Portal.
- Select a database name for the Recipes. The default is Recipe.System.
- Click OK to continue. The installation wizard will now attempt to connect to the SQL server listed. If the proper credentials are not used, the connection will not be established.

RECIPE EDITOR INSTALLATION

If you checked the option to install the Recipe Editor, a setup program will launch after the databases are installed. To continue with the editor installation follow these steps:

1. Click Install.

4. From the Recipe System login screen, click Setup. You will need to setup the connection to the SQL database.
