Part 1: Recipe Portal and Editor Installation

[Previous](#) | [Next](#)

Installation

The installation wizard is broken up into two parts: the recipe viewer portal and database. If you choose to install the editor application, it will also run that wizard. This documentation will cover the entire installation wizard with the recipe editor option checked.

Log in to the NorthStar web site and Navigate to **Downloads> NS Recipe Viewer Downloads**. The installation has been broken out into two components: the recipe portal installation (which installs the web site and the SQL databases) and the Recipe Editor application. If you run the Portal installation and choose the option to also install the editor, the editor setup will run. If the editor setup does not start, you can run it manually from the NorthStar web site.

Part 1: Portal Installation

 If you have not read the requirements section, you must review it before installing. [Access the additional Microsoft requirements here.](#)

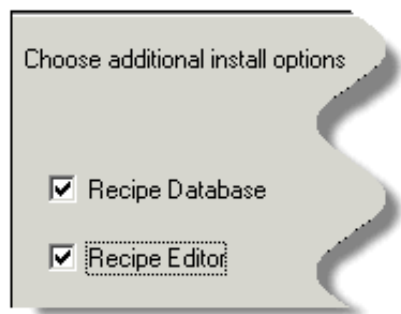

1. The install is located in **Downloads> NS Recipe Viewer Downloads**. Click on the NorthStar Recipe Viewer Portal 2.0 link. The install may take several minutes, depending on the system.

Note: The installation may require SQL Server components. Depending on your version of SQL, you may see the screen pictured below. If you are prompted for the SQL Server components, choose the **Install** button.

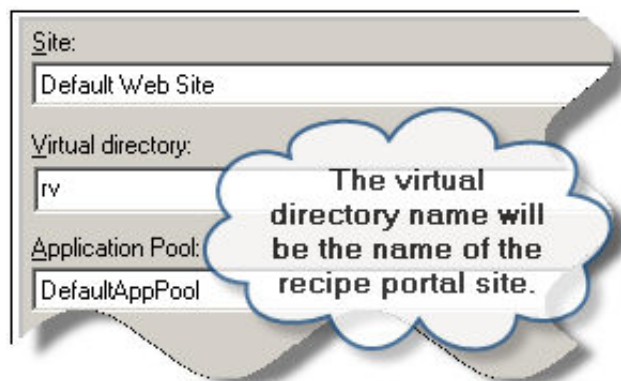

Note: Depending on the components that needed to be installed, you may be required to restart the computer. The installation will automatically continue after the restart.

2. Once the Recipe Viewer Setup Wizard opens, click **Next** to continue with the installation.
3. The EULA (End User License Agreement) will open. Click **I agree** and **Next** to continue.
4. Choose the options that you want to install. The options are the Recipe Database and the Recipe Editor. If this is the portal server, you will want to make sure that the Recipe Database is checked.

5. A Site dropdown will display. The Recipe Portal only installs as a virtual directory from a web site. Find the name of your web site in the dropdown menu.
6. Enter the Virtual directory name for the recipe web site; "rv" is the default.
7. If you want to use a different application pool, you can select it from the dropdown menu.
8. Click **Next** to continue.
9. Click **Next** again to complete the Portal installation (this installs the actual portal web site and configures IIS with the site information).

Once you have configured the site information, the database installation will start up in the wizard. [Click here for the Database Installation help.](#)
