Creating Recipe Systems: Adding a Recipe System

[Previous](#) | [Next](#)

What is a Recipe System?

The recipe system can be one complete concept or multiple concepts. Each recipe system is comprised of categories, groups and recipes. When you create the web portal for users to access recipes, you will need to choose a recipe system to display. For the most part, companies will only use one recipe system.

Administrators can add a system from the Control Panel. When you use the recipe editor for the first time, you will be prompted to add a recipe system before you are able to enter groups or recipes.

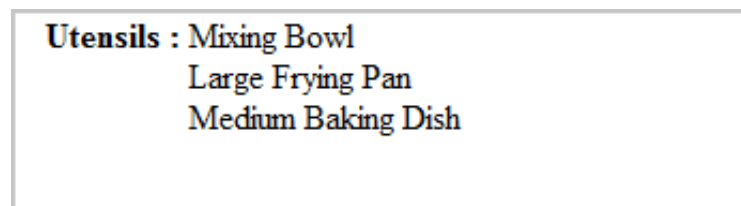

Adding a Recipe System

Navigate to the Control Panel view. If it is not open already, you can click **GO>Control Panel**.

1. From the Recipe Systems link, click **Add a Recipe System**.
2. Name and Describe your recipe system.
3. Enable or disable utensils. Click **Next**.

Utensils

By default the option to enable utensils for recipes is turned on. This enables the utensils section in the recipe display. You can change the title in the actual recipe if you prefer. The utensils section displays at the bottom right of the recipe. You can use it to show users the required kitchen utensils for the recipe. Utensils can be turned off from the **Manage a Recipe System** wizard or in **Tools>Options**.

4. Enter the languages you will use. The recipe portal allows users to toggle between languages. Recipe administrator's can create recipes in a different language. From the recipe portal, a user can then click on the language button (Spanish, etc.) to see the recipes that are created in that language. Click **Next**.
5. At this point you can save the recipe system and exit, or save the recipe system and setup the security. Unless you need to create other security roles besides the default system administrator, setting up the security is not necessary. For more on security roles, [click here](#).
